SAORSTÁT ÉIREANN.

CENSUS OF POPULATION, 1926.

VOLUME V. PART I.

AGES, ORPHANHOOD AND CONJUGAL CONDITIONS.

CLASSIFICATION BY AREAS ONLY.

EXPLANATORY NOTES.

Classification by ages is so fundamental that some age statistics will be found in every volume of the 1926 Census. For instance, in some of the Tables in Volume III. (Religions and Birthplaces) persons were classified according to both religion and ages, in other Tables of the same volume persons were classified according to both birthplaces and ages. Again, in some of the Tables in Volume IV. (Housing) the population was classified not only by housing conditions but also by ages, and in others by conjugal conditions. Volume II. (Occupations) did not include any detailed age classifications as the volume without them ran to considerable length. Similarly, the volume on industries will contain no detailed age classifications owing to the amount of other material that will have to be included in it. Part II. of the present Volume will accordingly contain detailed statistics of ages and conjugal conditions in each occupation and in each industry.

Statements of age at the Censuses in this country have always been much less accurate than, for instance, in Great Britain. Previous to 1926 only one column appeared on the Census Schedules for the question "Age last Birthday"; in 1926 in order to suggest that a statement as accurate as possible was required, two columns were provided asking for the ages correct to months. While a considerable improvement was shown in 1926 in the answers to this question still the replies were much too inaccurate, unreasonably large numbers of persons stating their ages in round numbers, especially as 50, 60, 70, etc., years of age. This defect will be seen in Table 11, which shows the number of persons at each individual year of age.

Notwithstanding the inaccuracies referred to, it will be found that when appropriate groups of ages are taken the numbers are sufficiently true

* Part II. will follow as a separate publication.

for practical purposes; for instance, for the life tables shown on pages 216-219. These life tables were calculated by Mr. R. C. Geary, M.Sc., of this Department, on much the same lines as those devised by Mr. George King, F.I.A., F.A.A. (see Part I. of the 75th Annual Report of the Registrar-General of England and Wales, Cd. 7512/1914), as modified by Sir Alfred Watson, K.C.B. (see Part I. of the Registrar-General's Decennial Supplement, England and Wales, 1921). Necessary departures from these methods are explained in the memorandum on page 220.

In the Census publications up to and including 1891 the numbers of persons whose ages were not stated on the schedules were shown separately. The numbers decreased from 4,919 (or 7 per 10,000) in 1841 to 1,460 (or 4 per 10,000) in 1891. As the numbers were very small in 1926 each case was considered separately and given an age suggested by other particulars on the schedule.

The Old Age Pensions Act, 1908, disturbs the comparability of the numbers of persons in the older age groups as recorded at previous and subsequent Censuses. The numbers were :—

Year	Population at Ages				
	55–59	60–64	65–69	70–74	75 and over
1901	107,096	152,952	70,584	69,106	69,582
1911	104,634	98,264	108,639	126,899	94,410
1926	125,713	105,146	101,212	82,246	88,222

The causes influencing the magnitudes of these figures must be borne in mind—the tendency to state the age at 60 and 70, the changes in the numbers born at different periods during the last century (a number increasing at the commencement and decreasing at the end of the century), the somewhat similar changes in the numbers of emigrants, the usual age at which the emigrants left the country, the decreasing death rates. The influences of these causes on age statistics are too intricate to be dealt with in detail here.

Each person 15 years of age or over was required to be described on the Census Schedule as " married," " widowed," or " single." The very few persons in respect of whom such statements were omitted were given the descriptions suggested by other particulars on the forms. From the numbers " married," " widowed " and " single " classified by age groups as shown in the tables in this publication further tables were compiled, and are included in this volume, showing the number of " single " persons in each age group expressed as a percentage of the total in that age group. A comparison of such results for this and other countries (see page 215) indicates the unique position of this country with regard to the low proportion of persons married, especially in the younger age groups. An international comparison of ages will be found on page 214.

The 1926 Census was the first at which particulars of orphanhood conditions were collected. Children under 15 years of age were required to be described in the Schedules according to the following classifications: (1) "both parents alive"; (2) "having father alive, mother dead"; (3) "having mother alive, father dead"; (4) "having both parents dead." Tables showing the numbers thus recorded will be found in the present Volume. Later on tables will be published showing the numbers of married men, widowers, and widows classified according to the number of their dependent children—*i.e.*, children and step-childern under 16—and further classified according to areas, industries, occupations, ages, etc.

JOHN HOOPER,

Director of Statistics.

December, 1929.

TABLE I :—TOTAL PERSONS, MALES AND FEMALES IN **SAORSTAT EIREANN** AT EACH OF THE NINE CENSUSES FROM 1841 TO 1926 CLASSIFIED ACCORDING TO AGE GROUPS.

NOTE :—The Military and Navy are not included in the figures in this Table for 1841 and 1851, but are included for subsequent years

TABLE 22 :—SAORSTAT LIFE TABLE NO. 1—MALES

(For explanation of calculation *see* Memorandum on p. 220).

KEY TO THE NOTATION.

q_x=the rate of mortality, or the probability of dying in a year. It is the ratio of the number of deaths in the year of age x to $x+1$ to the number entering on the year.

p_x=the probability of living a year, or the ratio of the number completing the year of age x to $x+1$ to the number entering on the year.

l_x=the number according to the life table surviving to exact age x.

d_x=the deaths in the year of age x to $x+1$ among l_x persons who enter on that year.

L_x=the population according to the life table, or the years of life lived, in the year of age x to $x+1$.

T_x=the population, or the years of life lived, above the moment of age x.

$\mathring{e}_x$=the complete expectation of life, or the total future lifetime which on the average will be passed through by persons aged exactly x.

The following relations hold between these quantities :—

$$p_x = 1-q_x\,,\ l_x - l_{x+1} = d_x\,;\ L_x = \tfrac{1}{2}(l_x + l_{x+1})\ (x>0)\,;\ T_x = \sum_{y \geq x} l_y\,;\ \mathring{e}_x = T_x/l_x\,.$$

Age. x	l_x	d_x	p_x	q_x	L_x	T_x	$\mathring{e}_x$	Age. x

MEMORANDUM

ON THE CONSTRUCTION OF

SAORSTAT LIFE TABLE NO. 1.

The methods used by Mr. George King in the construction of English Life Tables Nos. 7 (1901–10) and 8 (1910–12)* and adopted by Sir Alfred Watson in the construction of English Life Table No. 9 (1920 22)† were used in the construction of the table (pp. 216–219). Slight modifications in the methods were rendered necessary by the nature of the data available here.

At ages 5 and over the life table data were calculated from the population in 1926 as recorded at the Census and the numbers of deaths in 1925, 1926 and 1927 as recorded in the annual returns of the Registrar-General of Saorstát Eireann. From these statistics the "central death rate" m_x which equals

$\frac{1}{3}$ (deaths at age x in the years 1925, 1926 and 1927)
÷ population at age x at the 1926 Census

was calculated at certain "pivotal" ages x.

As mortality data by single years of age were not available and as the accurate statement of age at the Census left much to be desired, it was necessary to calculate "graduated" numbers of deaths and population at the pivotal ages from mortality and Census statistics suitably grouped. The method by which these graduated functions were derived from the grouped data is described by Mr. King. Both mortality and population statistics were available by single years in England and Wales in the years 1910–12 and Mr. King found that most accurate results would be obtained by using the quinquennial grouping 4–8, 9–13, etc., to 99–103. (Sir Alfred Watson used the grouping 2–6, 7–11, 12–16, etc.). Then from deaths at ages 4–8, 9–13 and 14–18 a graduated number of deaths at the central age 11 was calculated and similarly a graduated population at age 11. The quotient gave the central death rate m_{11} at age 11. Similarly from the age groups 9–13, 14–18 and 19–23 the central death rate at age 16 was found, and so on. From these values of m_x at ages 11, 16, 21, etc., values of q_x, the probability at exact age x of dying during the ensuing year was found from the formula $q_x = \frac{2m_x}{2 + m_x}$.

Most of the intervening values of q_x were calculated by the method of "osculatory interpolation," also described by Mr. King, the values of q_{11}, q_{16}, q_{21}, and q_{26} being used to calculate the values of q_{17}, q_{18}, q_{19} and q_{20}, the values of q_{16}, q_{21}, q_{26} and q_{31} being used to calculate the values between q_{21} and q_{26}, etc. At the ages 0 to 5 the values of q_x were based solely on vital statistics, and at the old ages on the values of q_x at ages 88, 89, 90, 91 and 96.

These methods had to be modified for application to Saorstát statistics. In the first place, deaths at ages 5 and over were available only by quinquennial age groups 5–9, 10–14, etc. Choice of grouping was therefore restricted to these groups or to combinations of them. In the second place, the very marked tendency at the Saorstát Census towards giving ages in round numbers 40, 50, 60, etc., rendered it necessary to adopt a wider age grouping than that used by Mr. King. It was decided to use quinquennial grouping from ages 5–9 to 40–44 and (as these inaccuracies of age statement were more pronounced at the older ages) a partially overlapping decennial grouping from 25–34 to 95–104. From the quinquennial groups graduated numbers of deaths and of populations (and hence the values of q_x) at ages 12, 17, etc., to 37 were obtained and from the decennial grouping the values of q_x at ages 40, 50, etc., to 90. All values of q_x from $x=17$ to $x=32$ were calculated by osculatory interpolation from the quinquennial data [using, with Mr. King, the function $log\ (q_x+.1)$] and from the values of q_{30}, q_{40}, etc., to q_{90} the values of q_x for single years from $x=40$ to $x=80$ were obtained. The values from $x=33$ to $x=39$ were calculated by a Lagrangean interpolation from the values of q_{31}, q_{32}, q_{40}, and q_{41}. Thus unbroken series of values of q_x for males and females separately were found from $x=17$ to $x=80$.

* Supplement to the 75th Annual Report of the Registrar-General of Births, Deaths and Marriages in England and Wales, Part I. Life Tables (Cd. 7512/1914).

† The Registrar-General's Decennial Supplement, England and Wales, 1921. Part I. Life Tables (1927).

The values of q_x for ages 0 to 4 were derived solely from births and from deaths at ages 0, 1, 2, 3 and 4 using Sir Alfred Watson's formulae‡. From the mortality and population data grouped in ages 2–4, 5–9 and 10–14 the graduated number of deaths and of population at age 7 (and hence the value of q_7) were calculated. The remaining values of q_x from $x=5$ to $x=16$ were calculated by a Lagrangean interpolation from the known values of q_3, q_4, q_7, q_{12}, q_{17}, and q_{18}.

Mr. King obtained the values of q_x for advanced ages from a fourth difference formula based on the values of q_{88}, q_{89}, q_{90}, q_{91}, and q_{96}. Sir Alfred Watson used a "Gompertz" graduation to obtain the values of q_{85} and upwards as it was observed that the ratio $\frac{log\ p_{89}}{log\ p_{84}}$ ($p_x=1-q_x$) was approximately equal to $\frac{log\ p_{94}}{log\ p_{89}}$. This condition was tested for the Saorstát pivotal values q_{70}, q_{80}, and q_{90}, and as it did not apply with sufficient accuracy a "Makeham" graduation based on the values of p_{70}, p_{80} and p_{90} was used instead.

The resulting series of values of q_x from $x=0$ to $x=107$ are of smooth graduation. That they reflect mortality in Saorstát Eireann accurately will be seen from the following table in which the actual deaths in the three years 1925–1927 are compared with the deaths as calculated from the life table :

Ages	Males			Females		
	Actual Deaths 1925–1927	Expected Deaths 1925–1927	Deviation : Expected less Actual	Actual Deaths 1925–1927	Expected Deaths 1925–1927	Deviation : Expected less Actual
0–4	10,633	10,633	—	8,900	8,900	—
5–9	1,080	1,062	—18	1,132	1,111	—21
10–14	751	760	+ 9	900	908	+ 8
15–19	1,413	1,371	—42	1,572	1,535	—37
20–24	1,640	1,642	+ 2	1,687	1,693	+ 6
25–34	3,139	3,151	+12	3,533	3,535	+ 2
35–44	3,647	3,634	—13	3,822	3,806	—16
45–54	5,810	5,867	+57	5,392	5,460	+68
55–64	8,579	8,579	—	7,717	7,706	—11
65–74	12,944	13,010	+66	13,086	13,050	—36
75–84	10,822	10,860	+38	11,817	11,809	— 8
85–94	3,908	3,981	+73	4,236	4,299	+63
95 and over	408	449	+41	499	504	+ 5
Total 5 years and and over	54,141	54,366	+225	55,393	55,416	+23

As the values of q_x from $x=0$ to $x=4$ were calculated from vital statistics only, actual and expected deaths have been entered at the same figures in the foregoing table. It will be seen that in each of the remaining age groups there is a satisfactory correspondence between actual and expected deaths. In the aggregate of all deaths of males 5 years of age and over the discrepancy is only +225 in 54,141 actual deaths. The discrepancy is only +23 in 55,393 actual deaths of females 5 years and over.

R. C. Geary.

‡ *Op. cit. p.* 30.
